Whether the application is temporary or more permanent, at EcoGrid we have the solution. The World leading EcoGrid range is unique in it's ability to withstand heavy trafficking whilst allowing the sun to keep the grassed areas from dying off.

Laying is both swift and simple, as is taking the product up after an event (with specialist instruction). The EcoGrid sections can be then put in to storage ready for re-laying the next time. Sections of grids can easily be assembled-dis-assembled in a variety of sizes, 4 tiles, 1 square metre, 5 square metres or multiples thereof.

Some of the biggest problems facing campgrounds is soil compaction, mud and erosion through heavy use. EcoGrid is significant in being able to decrease the impact of traffic (foot and vehicular) on grass and other natural permeable surfaces. The grid system reinforces the ground acting like as "snowshoe", thus reducing soil compaction, improving water drainage and as a result preventing mud and erosion.

EcoGrid enables sustainable grassed camp sites. By maintaining a non-compacted area for grass to grow in, campground owners can ensure good grass coverage while maintaining a permeable surface area. The grid protects the roots of the grass and growth areas of the grass plant while providing a stable surface.

After correct installation, EcoGrid is virtually maintenance free. Therefore ongoing campground costs are also decreased.

If a really temporary roadway is required, no problem, we have a special joining piece known as a 'Trickrast' joint which stops the grids from locking together and allows easier assemble. We also have a unique grid section that allows the EcoGrid to be set in a continuous curve without the need for cutting.

EcoGrid...On firm ground.
